| # Users | ∞ | ∞ |
| # Units | Pay per Unit per Month | ∞ |

Couple of features explained:

**Data Manager (Unit level - customer feature available in CardsOnline)**

The data manager gives you an overview of all the card holders' records. Add card holders' data manually in the data manager, add a single record or import data using an Excel file and add photos from file or capture 'live' with a camera.

**Data Tasks Manager (Host level - host administrator feature available in CardsOnline)**

Easy way to setup and manage a standard set of data tasks for automatic import and export of data. A data task is a script that collects information or performs a task in the background at a particular schedule. For example mutations in databases like employees and/or students data, data tasks automatically runs at a set interval to update your data records in the data manager.

**Custom Data Agents (Custom customer specific script, additional request - ScreenCheck Developer)**

An Organization can request to let a custom data agent be written to automatically import, export and update users' data to and from a specific system. For example: synchronizing the users' information of the school library system or HR system with the CardsOnline system.
